

PROPOSAL · NATURE'S JOY HERBAL COSMETICS

PulseCommerce

Customer intelligence and WhatsApp campaigns for your WooCommerce store — built on your own infrastructure, with no per-message fees.

₹35,000

One-time, private gateway

₹0

Per message, forever

13

Modules delivered

WooCommerce reports on orders. It says nothing about people.

Your admin shows sales by date and a list of top products. It is transaction-centric by design. Every question below needs computation across your entire order history, and none can be read off a WooCommerce screen.

Who is leaving

Which customers have quietly stopped buying, judged against their own reorder rhythm rather than a fixed rule.

What it is worth

What each customer is likely to spend next, and how exposed the business is if the top few walk away.

How to reach them

Once a group worth contacting is identified — how do you actually message them without exporting a spreadsheet?

Twelve months, measured

Every figure on the next five slides was computed from [naturesjoystore.com](#) during development.
Nothing here is an estimate or an illustration.

₹70.7L

Net revenue across twelve months*

20,444

Orders placed, 16,317 of them
revenue-generating

11,224

Distinct customers

40,602

Units sold

₹434

Average order value

₹632

Revenue per customer, lifetime

23.8%

Customers who ordered more than
once

18.1%

Orders cancelled — 3,709 of them**

* · Net revenue excludes tax, shipping and refunds, and counts only completed, processing and on-hold orders. ** · Cancellation rate is cancelled orders as a share of all orders placed, including failed and pending.

A business that has found its level

Revenue climbed steeply to November 2025, then settled into a band between ₹5.7L and ₹7.0L a month and stayed there for eight months. Growth from here comes from the customers you already have, not from the trend continuing on its own.

One product carries a third of the business

This is the single largest risk in the data. A stock-out, a supply problem or a formulation change on one product would take a third of revenue with it. Inventory planning and reorder alerts exist for exactly this.

Tamil Nadu is the business

86.5%

Of revenue comes from Tamil Nadu

₹19.1L

From Chennai alone — 27% of everything

₹5.1L

Karnataka, the clearest expansion signal

Concentration this high is a strength for logistics and a risk for growth. Karnataka is already buying without being targeted, which makes it the cheapest market to test a campaign in.

8,551 people bought once and never came back

11,224

Customers in twelve months

2,673

Ordered more than once

8,551

Ordered exactly once

76.2%

Of your customer base, never reactivated

If a win-back campaign converts	Customers returning	Revenue at ₹434 AOV*
2%	171	₹74,214
5%	428	₹1,85,752
10%	855	₹3,71,070

At a 2% conversion — deliberately pessimistic for customers who have already bought from you once — a single win-back campaign returns roughly twice the cost of the Cloud API build.

* · Illustrative only. Conversion rates are assumptions, not forecasts or guarantees, and assume the average order value observed over the period holds.

Thirteen modules

01 Revenue & performance

Every KPI against the equal-length prior period

02 Customer analytics

RFM, ten segments, tiers, lifetime value, churn risk

03 Customer profiles

Full history, channel, device, what they buy

04 Acquisition & retention

Channels, devices, cohorts, time to second order

05 Campaigns & audiences

Goal-driven audience builder with live reach

06 WhatsApp campaigns & flows

Ten templates, coupons, and multi-step sequences that send themselves

07 Shared inbox & auto-reply

Replies with the customer's history beside them, and a menu bot out of hours

08 Product analytics

ABC classification, refund rate, basket affinity

09 Inventory planning

Days of cover, reorder points, revenue at risk

10 Orders & operations

Register, payments, coupons, trading heatmap

11 Forecasting

Trend and seasonality with a 95% band

12 Geography

Revenue by state, city and region

13 Reports & exports

Ten reports as Excel, PDF or CSV

All included

One price, no per-module charge

Revenue & performance

What did the business actually do, and is it better or worse than the period before?

₹70.7L

Net revenue, twelve months*

₹434

Average order value

₹7.21L

Best month — November 2025

40,602

Units sold

Every figure is shown against the equal-length previous period, so "good month" is a comparison rather than a feeling. Revenue and orders share one axis, because two axes on one chart can be drawn to say anything.

* · Net revenue excludes tax, shipping and refunds, and counts only orders in completed, processing or on-hold status. Window: 1 August 2025 to 31 July 2026.

Customer analytics

Who is worth keeping, who is slipping away, and how exposed are you if the best ones leave?

11,224

Customers scored

9.1%

Of revenue from your top 1%

₹17,314

Your single largest customer, across 17 orders

2,673

Customers who ordered more than once

Every customer gets an RFM score, a value tier, a predicted lifetime value and a churn risk judged against their own reorder rhythm — so a seasonal buyer is not flagged as lost for behaving normally.

Customer profiles

Everything about one person, on one screen, before you speak to them.

Your top customer	Value
Orders placed	17
Lifetime spend	₹17,314
Average order	₹1,018
Segment	Champion
Churn risk	Low
Buys most	Manjistha Soap

Identity, location, how they found you, what device they used, what they buy, their revenue percentile, and every order they have placed — reachable from any table in the product.

Acquisition & retention

Where do new customers come from, and how long before they come back?

8,551

Customers who ordered exactly once

39 days

Median gap before a second order

23.8%

Repeat rate across the base

12

Monthly cohorts tracked

The 39-day median is the number to act on: it defines the window a follow-up should land in. Cohorts are tracked monthly, so you can see whether customers acquired in March behave differently from those acquired in June.

Campaigns & audiences

Turn a finding into a list of people, with the value at stake shown before you send.

Audience	Customers	Revenue represented
Bought once, still recent	8,551	₹37.1L potential*
Ordered 2+ times	2,673	₹33.6L historic
Top 1% by spend	113	₹6.4L historic
Karnataka customers	~840	₹5.1L historic

Six goal-driven presets, or build your own from segment, tier, spend, recency, churn risk, location and product bought. Reach and revenue update as you filter.

* · Potential revenue is the count multiplied by the average order value. It is an illustration of scale, not a forecast, and assumes nothing about conversion.

WhatsApp campaigns

Message that audience directly, with each person seeing what they actually buy.

As one customer receives it

Hi Priya, it has been a while since your last **Manjistha Soap**.

Here is 10% off with code **SAVE10NOW**:

naturesjoystore.com/product/manjistha-soap

— Nature's Joy

- **Nine templates** for reorder, win-back, second order, review requests and offers
- **Ten variables** resolved per person from their own orders
- **Coupons created** in WooCommerce, limited to one use each
- **Paced sending** that survives a gateway restart*

* - Sending uses a self-hosted gateway rather than Meta's official API. Delivery is not guaranteed and the linked number carries a risk of restriction by WhatsApp. A dedicated number should be used.

Shared WhatsApp inbox

Replies land where the business can see them, next to who sent them.

Live

Replies arrive without a refresh

Full

Order history beside every conversation

Any

Text, media or a catalogue product

Search

Across names and numbers

Answering "is this back in stock?" is a different conversation when you can see the person asking has ordered eleven times. The opt-out list applies here too.

Nine messages, each written for a job

Template	What it says	When to send it
Reorder	Names the product they bought, links to it	Their usual reorder gap has passed
Category arrivals	New items in the range they already shop	You add stock to a category
Win back	References their product and last order date	At Risk or Hibernating segments
Second order	Asks how they got on, invites a repeat	One-time buyers, still recent
VIP thank you	Names their order count, invites a reply	Champions and top-tier customers
Review request	Asks for feedback on what they buy	Repeat customers with a recent order
Coupon + product	A discount tied to their own product	Lapsed customers worth converting
Coupon only	A store-wide discount offer	Any audience, no clear favourite
Announcement	Your own words, greeting still personal	News, hours, anything else

Templates are edited freely before sending. No approval process applies, unlike Meta's official API.

Ten variables, resolved per person

Variable	Becomes, for one customer
{{name}}	Priya
{{product}}	Manjistha Soap
{{product_url}}	The buy link for that product
{{category}}	Herbal Soaps
{{last_order}}	14 March

Variable	Becomes, for one customer
{{orders}}	7
{{spend}}	₹4,180
{{store}}	Nature's Joy
{{coupon}}	SAVE10NOW
{{coupon_value}}	10% off

The product chosen is the one they have spent the most on, not their most recent — a one-off small purchase should not become the thing a reorder message is built around. A variable with no value for someone is removed and the sentence tidied, so nobody receives a literal placeholder or a dangling comma.

Discounts created, tracked and spent

- **Created in WooCommerce** from the campaign screen — the code exists in your store immediately
- **One use per customer**, so a code shared publicly cannot be spent repeatedly
- **Expires** on a date you set, so campaign codes do not linger
- **Restricted to the product** being promoted, when you pick one
- **Codes avoid 0, 0, I and 1**, because they get read off a phone and typed at a checkout
- **Expired or exhausted codes cannot be selected** — a code that will be refused is worse than none

Coupon performance, reported back

Uses · Discount given · Revenue produced · Return on discount

You see whether the offer bought incremental orders or simply discounted sales that would have happened anyway.

* Creating a coupon is the only action this software takes that changes your store. Nothing modifies an order, a product or a setting.

How 11,224 messages actually go out

4s

Between messages, with random jitter so sends do not look mechanical

100

Recipients per batch handed to the gateway

Resumable

Closing the page pauses; reopening continues

Automatic

Recovers by itself if the gateway restarts mid-send

Who is excluded, and why

Every dropped recipient is counted and categorised: no phone number on file, a number that cannot be read, a duplicate shared with another record, or someone on the opt-out list. "Sent 9,800 of 11,224" always has an explanation.

Why pacing matters

Sending thousands of messages in minutes is the single most reliable way to get a WhatsApp number restricted. Deliberate spacing is what keeps the number usable over months rather than days.*

* Pacing materially reduces risk but does not eliminate it. See the terms slide.

Product & catalogue analytics

Which products carry the business, which are dead weight, and what sells together?

74

Distinct products sold

10

Class A — the first 80% of revenue

18

Class B — the next 15%

46

Class C — the last 5%

Ten products out of 74 produce four-fifths of your revenue. The other 46 together account for less than a twentieth — worth knowing before deciding what to restock, discount or discontinue.

Inventory & restock planning

What runs out next, and what is it worth if it does?

Manjistha Soap	Value
Units sold, twelve months	13,334
Average daily velocity	~37 units
Share of product revenue	33.3%
Revenue exposed per week out of stock	≈ ₹45,000*

Days of cover, reorder points from your supplier lead time, suggested order quantities, and a CSV shaped as a draft purchase order.

* - Calculated from observed sales velocity over the period. Actual exposure depends on substitution, seasonality and stock levels at the time.

Orders & operations

What is happening to orders after they are placed?

18.1%

Orders cancelled — 3,709 of them

15,998

Orders completed

Sunday

Your busiest trading day

3pm

Your busiest hour

The cancellation rate is the finding worth investigating first. Whether it is genuine cancellations or a checkout problem changes what you do about it — and the order register makes the difference visible.

Forecasting

What does next month look like, and is the store pacing ahead or behind?

₹6.5L

Recent monthly run rate

95%

Confidence band on the projection

Weekly

Seasonality shown explicitly

30 days

Default forecast horizon

A least-squares trend multiplied by day-of-week seasonality. It answers whether you are pacing ahead of or behind your own recent trend. It knows nothing about planned promotions or stock-outs, and says so.

* - Forecasts are statistical projections from historic data, not commitments. They exclude planned campaigns, stock availability and seasonality outside the period analysed.

Geography

Where is the revenue, and where is the next market?

Location	Net revenue	Share
Tamil Nadu	₹61.3L	86.5%
Chennai alone	₹19.1L	27.0%
Karnataka	₹5.1L	7.2%
Puducherry	₹1.4L	1.9%

Karnataka is already buying ₹5.1L a year without being targeted. That makes it the cheapest market to test a campaign in, and the clearest expansion signal in the data.

Reports & exports

Take any of it out, in the format the person asking for it uses.

10

Report types

Excel

Formatted sheets with filters

PDF

Board-ready with a cover

CSV

For spreadsheets and pipelines

Executive summary, customer ledger, segmentation, products, categories, order register, cohorts, geography, operations and forecast — with presets for a board pack, a CRM upload, a merchandising review or a finance reconciliation.

How the three pieces connect

Store access is read-only, with one exception: creating the discount coupons you ask for. Nothing modifies an order, a product or a store setting.

Keyboard-first, for people who live in it

Every screen is one or two keystrokes away. Shortcuts are ignored while you are typing, so they never eat a search query.

Search & actions

-  **K** Search everything
- /** Jump to search
- ?** Show all shortcuts
-   **R** Re-sync store
-   **L** Light / dark

Go to — press **g** then

- d** Dashboard
- c** Customers
- a** Acquisition
- h** Cohorts
- p** Products
- i** Inventory
- o** Orders
- m** Campaigns
- w** WhatsApp inbox
- f** Forecast
- r** Reports
- s** Settings

The command palette searches customers, products and orders together — type a name, a phone number or an order number and go straight there.

Four gates between you and 11,224 people

* • Dry run

Resolves the real recipient list and sends nothing. Shows who was excluded and why, plus the message as the first recipient would read it.

** • Test send

One message to a number you type by hand. It cannot reach a customer.

*** • Typed confirmation

You type the exact recipient count. The audience is recalculated and the send refused if it changed.

**** • Opt-out list

Applied on the server after the audience is built, so no filtering mistake can route around it.

Duplicate numbers across records are collapsed so a household is messaged once, and every excluded recipient is counted and categorised — so "sent 9,800 of 11,224" always has an explanation.

What the tools you already have cannot do

Capability	PulseCommerce	WooCommerce Analytics	Google Analytics
Customer segmentation	✓	✗	✗
RFM analysis	✓	✗	✗
Customer lifetime value	✓	✗	✗
Churn prediction	✓	✗	✗
Inventory analytics	✓	Basic	✗
WhatsApp campaigns	✓	✗	✗
Customer profiles	✓	✗	✗
Forecasting	✓	✗	✗
Self-hosted option	✓	✗	✗
One-time purchase	✓	✗	✗

* Based on the standard published feature sets of each product at the time of writing. Third-party offerings change; verify before relying on any comparison.

Against the WhatsApp platforms

Capability	PulseCommerce	AiSensy	WATI	WooCommerce Reports
Customer analytics	✓	✗	✗	Basic
RFM segmentation	✓	✗	✗	✗
Churn prediction	✓	✗	✗	✗
Inventory analytics	✓	✗	✗	Basic
WhatsApp campaigns	✓	✓	✓	✗
Shared inbox	✓	✓	✓	✗
Forecasting	✓	✗	✗	✗
Customer lifetime value	✓	✗	✗	✗
Self-hosted option	✓	✗	✗	✗

The messaging platforms send well and know nothing about your customers. The analytics tools know your customers and cannot message them. This does both, which is the whole point — an audience defined by churn risk can be messaged without ever leaving the screen.

Every platform bills monthly, then Meta bills again

Platform	Starting price	On top of that
AiSensy	₹1,500 / month	Meta message charges
Gallabox	≈ ₹2,399 / month	Meta message charges
Interakt	≈ ₹2,799 / month	Meta message charges
WATI	≈ \$39 / month (₹3,300+)	Meta message charges
Gupshup	Custom pricing	Meta message charges
PulseCommerce, self-hosted	₹0 / month	Server hosting only, ≈ ₹500

Every one of these is a subscription you keep paying, and none of it covers what Meta charges per conversation. A self-hosted gateway removes both the subscription and the per-message fee, leaving a server bill.

* Publicly listed starting prices at the time of writing, converted where necessary. Prices, plans and inclusions change; confirm with each vendor.

What each route actually costs

One campaign a month to your 11,224 customers, with Meta charging approximately ₹10,000 a month for them.*

Route	Subscription	Meta charges	Three-year total
AiSensy	₹54,000	₹3,60,000	₹4,14,000
Gallabox	₹86,364	₹3,60,000	₹4,46,364
Interakt	₹1,00,764	₹3,60,000	₹4,60,764
WATI	₹1,18,800	₹3,60,000	₹4,78,800
PulseCommerce + Cloud API	₹25,000 once	₹3,60,000	₹3,85,000
PulseCommerce + private gateway	₹35,000 once	₹0	₹53,000

Against the cheapest subscription platform, the private gateway saves **₹3,61,000 over three years** — more than ten times what the build costs. The saving is almost entirely the per-message fee that disappears.

* Meta's rates vary by country and category and change without notice. Volume assumption is illustrative. See the terms slides.

Two ways to send WhatsApp

	Official WhatsApp Cloud API	PulseCommerce, self-hosted
Cost per message	Billed per conversation, in INR	Zero
Marketing messages	Charged at the marketing rate	No charge
Message templates	Pre-approval required by Meta	Write and send immediately
Setup	Meta Business verification	Scan a QR code
Running cost	Per conversation, forever	A small server, roughly ₹500/month
Tappable buttons	Yes	No — link previews instead
Delivery guarantee	Official, guaranteed	Unofficial; use a dedicated number

Meta's per-conversation rates change by country and category and should be confirmed against their current published pricing before you commit. The structural difference does not change: one bills per message, the other does not.

* · Meta's per-conversation rates vary by country and message category and change over time; confirm against their current published pricing. ** · Hosting is an estimate, billed by your provider, not by Setups Works.

One campaign to your customer base

11,224 customers. Because the exact Meta rate varies, here is the cost across the plausible range — and what it becomes at one campaign a month.

If a marketing conversation costs*	One campaign	Monthly, for a year	PulseCommerce
₹0.50	₹5,612	₹67,344	₹0
₹0.75	₹8,418	₹1,01,016	₹0
₹1.00	₹11,224	₹1,34,688	₹0

4 campaigns

Break-even on the ₹35,000 private gateway, at the middle rate

₹60,016

Saved in year one at one campaign a month, after the build and hosting

₹8,418

Meta charges avoided on every single campaign

Built for a store your size

Measured against your live store, not a test fixture.

20,444

Orders analysed

11,224

Customers scored

0.7s

Typical page load

81%

Data transfer removed by trimming
what is never read

Why it is fast

Your entire order history is pulled once and cached. Every metric is computed from that cache, so changing a date range costs milliseconds instead of another wait on your store.

Why your store stays fast

Analysis never touches the database serving your storefront. Pulls are paced and retried, so a sync reads as ordinary traffic rather than a spike.

What you receive

- **The platform**, all thirteen modules — including automated multi-step flows and the out-of-hours menu bot — deployed and verified against your live store.
- **The source code**, in a repository Nature's Joy owns outright.
- **WhatsApp gateway** installed and connected on your server.
- **Documentation** covering setup, configuration, architecture and troubleshooting.
- **Metric definitions in writing**, so every figure can be reconciled against WooCommerce rather than taken on trust.
- **Handover session** covering day-to-day use and how to read each module.

Not included

Stated plainly so there are no surprises later.

Server hosting for the WhatsApp gateway, roughly ₹500 per month, billed by your provider. Setups Works can manage it, quoted separately.

A dedicated phone number for WhatsApp sending, which should not be the main business line.

Your own private WhatsApp gateway

A dedicated WhatsApp messaging server, running on infrastructure Nature's Joy controls. Not a shared platform, not a reseller account.

Nobody between you and WhatsApp

No platform sits in the middle holding your customer list, your message history or your number. The gateway is yours, on your server.

No per-message fee, ever

Messages cost nothing to send. The only running cost is the server itself, roughly ₹500 a month, billed by your host.

No subscription to cancel

Nothing to renew, no plan to outgrow, no price rise. The software is yours with the source code.

What you give up

Delivery is not guaranteed the way Meta's official API guarantees it, tappable buttons are unavailable, and WhatsApp may restrict the number used. A dedicated number is essential.*

Who it suits

A store messaging its own past customers at volume, where the per-message fee dominates the cost and an occasional undelivered message is tolerable.

* See the terms slides. If guaranteed delivery matters more than cost, the Cloud API option below is the right choice.

Pay once, or pay every month

₹35,000

once, then nothing

PulseCommerce + your own private WhatsApp gateway

- All thirteen modules, automated flows included
- **No cost per message, ever**
- No template approval — write and send
- ≈ ₹500/month server, billed by your host
- Delivery not guaranteed; dedicated number needed

₹25,000

once, then ≈ ₹10,000 every month*

PulseCommerce + Meta's official WhatsApp Cloud API

- All thirteen modules, automated flows included
- Meta charges per conversation, forever
- Templates need Meta's approval
- Guaranteed delivery, tappable buttons
- No server to run

Over three years that is **₹53,000** against **₹3,85,000**. The difference is not the build — it is the per-message fee, which never stops.

Both cover the thirteen modules and nothing beyond them. Additional modules, custom metrics, integrations, automation, support or managed hosting are quoted separately and never started without a written quotation you have accepted.

* One campaign a month to your 11,224 customers, at roughly ₹0.89 per marketing conversation. Meta sets these rates and changes them without notice.

Ask the business a question

Every figure in this deck came from a report someone had to open. This asks in plain English and answers from the same numbers the dashboards use — so it can never quote a figure the screens disagree with.

What it can read

Revenue and every KPI with its previous-period comparison · customer segments and value tiers · top customers by spend or by order count · product performance and slow movers · stock at risk · how many customers an audience would reach · your automated flows · the menu bot · whether WhatsApp is connected.

It shows its working

Each answer lists which figures it consulted, so a number can be traced rather than trusted. It is instructed never to state a figure it has not read, and it has no access to phone numbers or email addresses at all.

Conversations are kept

Past questions are listed beside the chat and can be reopened or deleted. They stay in your browser rather than on a server, so no second copy of your business data exists to secure.

It proposes. You approve.

Ask it to write a message and it drafts one — then stops. Nothing is sent, changed or switched on until a person presses Approve.

What a proposal can be

A test message to a number you type · a message to named customers it has just listed for you · turning the auto-reply menu on or off · rewriting that menu · starting or pausing a flow · generating a PDF, Excel or CSV report.

Approving changes nothing about the rules

An approved proposal runs through exactly the same route the corresponding screen uses, with the same checks — unreachable and opted-out customers are still excluded, and the count sent is the platform's own, not the assistant's.

It cannot message everyone

There is no tool for sending to an audience, however it is asked. A broadcast starts from the Campaigns screen, by a person, behind a typed confirmation. Asked directly to message all customers and told not to seek permission, it declines and explains why.*

Campaigns that run themselves

A campaign is one message, now. A flow is a sequence that runs over days, so a customer receives the right message at the right point rather than whenever somebody remembered to send one.

A worked example

A customer goes quiet past their own usual reorder gap.

Day 0 — a reminder naming the product they actually buy, with its photo and a link.

Day 3 — a 10% code, created in WooCommerce, restricted to that product, expiring in a fortnight.

Day 10 — a last note before the code lapses.

They order on day 4. Steps two and three never send.

How it behaves

Customers join as they qualify. The audience is re-checked on every run, so whoever lapses next month enters next month. A flow keeps working rather than sending once to whoever matched on the day.

Nobody enters twice, for the life of the flow.

They leave the moment it works. A customer who buys stops receiving the rest. A win-back that keeps nagging someone who already came back is worse than not running at all.

Why the timing holds

Each wait is measured from when the previous message actually sent, not from when the customer joined — so a delayed run never bunches two messages together.

A run that is missed delays a step. It cannot lose one, and it cannot send one twice.

Before a customer sees it

A flow can be pointed at one test number, so a whole sequence is checked on your own phone first. Flows are created as drafts; starting one is a separate, deliberate act.

Answering before anyone is at a desk

Everything above reaches out. This is the other direction: a customer who messages at three in the morning currently waits until morning.

The menu

A customer sends an agreed word — “hi” — and receives a numbered menu straight away:

- 1 Order → shop link and order tracking
- 2 Contact us → how to reach a person
- 3 Feedback → an invitation to just type it

Menus nest as deeply as needed. Each conversation remembers where it is and forgets after fifteen minutes, so a stray number the next day is never read as a menu choice.

It never intercepts a real question

Only the exact trigger word starts the menu. Anything else is left for a person to answer, so a customer asking a genuine question reaches your team rather than a robot.

It runs on the gateway itself, which is why it answers whether or not anything else is running.

Included, not extra

This is part of the private-gateway option. There is no further charge from us for any extension listed here.

What else the gateway can take

Ten extensions are installed and available, each switched off until you want it:

Numbered menu bot · after-hours away message · keyword FAQ replies · voice-note transcription · group translation · logging to Google Sheets · calling your own systems on an inbound message · connectors for Chatwoot, Typebot and Supabase

Listed so the ceiling is visible, not because all of them are wanted. Several need outside services or paid APIs; those costs would be yours and are noted where they apply.*

Everything included, analytics

Revenue

Net and gross revenue · orders · average order value · units · discounts · shipping · tax · refunds · items per order · revenue per customer · cancellation rate · period-on-period comparison · day, week and month views · sparkline trends · generated findings ranked by urgency

Customers

RFM scoring · ten segments · five value tiers · predicted lifetime value · churn risk · revenue deciles · Pareto curve · Gini coefficient · recency-frequency plot · top-customer spotlight · high value, low value, at risk and rising cohorts · full ledger with expandable orders

Acquisition

New versus returning revenue · full customer tables · channel attribution · first-time buyer analysis by channel · device breakdown · pages per session · time to second order with quartiles · monthly cohort retention · cumulative lifetime value curve · attribution coverage

Products

ABC classification · Pareto concentration · revenue, units, orders and customers per product · price and velocity · refund rate per product · average rating · market-basket affinity by lift · category mix · best sellers by value and volume · slow movers · never-sold items

Inventory

Days of cover · reorder points from your lead time · suggested order quantities · out of stock, critical, low, healthy and overstocked states · revenue at risk · capital tied up · restock planner · draft purchase order export

Operations & forecast

Full order register · status mix · basket-size distribution · payment method performance · day-by-hour trading heatmap · weekday performance · fulfilment timing · daily revenue projection · 95% confidence band · weekday seasonality · geography by state, city and region

Everything included, messaging and platform

Campaigns

Audience builder with live reach · six goal presets · filters on segment, tier, recency, spend, orders, churn risk, country, account type, product bought and contactability · revenue and predicted value at stake · CSV export for email and ads platforms · campaign performance from UTM tags · coupon return on discount

WhatsApp

Text, image and video · ten templates · ten personalisation variables · per-customer product photos · catalogue product picker · coupon creation and attachment · dry run · test send · typed confirmation · opt-out list · paced sending with jitter · resumable jobs · automatic recovery · live progress and stop control

Automation

Multi-step flows up to ten messages · waits measured in days from the previous send · customers join as they qualify · nobody enters twice · exit the moment they order · test a whole sequence against one number · created as drafts · advanced by a scheduled job, so no browser need be open · inbound numbered menu bot answering out of hours

Inbox

Conversations matched to customers · order count and lifetime spend beside each · link to full profile · live reply polling · text, media and product replies · start a conversation from a number · unread counts · search across names and numbers · opt-out honoured

Reports

Ten report types · Excel with formatted sheets, filters and currency formats · PDF with cover, KPIs and findings · CSV for pipelines · board pack, CRM upload, merchandising and finance presets · written report view · exports match the on-screen date range and are never truncated

Platform

Multiple stores with instant switching · command palette across customers, products and orders · keyboard navigation throughout · light and dark themes · persisted date ranges · sortable, searchable, expandable tables · optional password protection · honest empty states · partial-data warnings surfaced

Security

Approval inside your own WordPress admin · no credential ever typed into a form · verified before saving · keys shown masked · phone numbers never sent to the browser · opt-outs enforced on the server · one-click disconnect wipes everything cached

What the figures mean

Measurement window

All store figures were computed from naturesjoystore.com covering 1 August 2025 to 31 July 2026, across 20,444 orders retrieved through the WooCommerce REST API. Figures change as the store trades and should be re-run before being relied upon.

How revenue is counted

Net revenue is order total less tax, shipping and refunds, counting only orders in completed, processing or on-hold status. Cancelled, failed and pending orders are excluded from revenue but included in cancellation rates. This may differ from figures shown elsewhere in WooCommerce, which counts differently.

How customers are counted

Guest checkouts carry no WooCommerce customer ID, so buyers are identified by billing email address. One person ordering under two email addresses counts as two customers. Customer counts and repeat rates are affected accordingly.

Projections and illustrations

Win-back revenue, campaign returns, break-even points and forecasts are illustrations based on stated assumptions. They are not forecasts, guarantees, warranties or commitments of any kind. Actual results will differ, potentially materially.

Statistical limits

Predicted lifetime value and churn risk are estimates derived from observed purchase behaviour. Forecasts use a least-squares trend with day-of-week seasonality and know nothing of planned promotions, stock availability, price changes or seasonality outside the period analysed.

Third-party pricing

WhatsApp Cloud API rates are set by Meta, vary by country and message category, and change without notice. The rates shown are illustrative ranges, not quotations. Confirm current pricing with Meta before making a decision on that basis.

Costs not included

Server hosting for the WhatsApp gateway, estimated at approximately ₹500 per month, is billed by your hosting provider and is not included in the quoted price. A dedicated phone number for WhatsApp sending is also not included. Domain, SSL and WooCommerce hosting remain your existing arrangements.

Inventory figures

Days of cover and revenue at risk are calculated from observed sales velocity and current stock levels where WooCommerce tracks them. Products without stock management enabled cannot be planned for.

Delivery, risk and the quote

WhatsApp delivery is not guaranteed

Messaging uses a self-hosted gateway connecting through unofficial, reverse-engineered clients rather than Meta's official WhatsApp Business API. Message delivery is not guaranteed. WhatsApp may, at its sole discretion and without notice, restrict, suspend or permanently ban any number used for automated messaging. No appeal route exists through this software or through Setups Works.

Use a dedicated number

A number reserved for this purpose must be used, never the primary business line. Setups Works accepts no liability for the restriction, loss or suspension of any number, for messages that fail to deliver, or for consequential business loss arising from either.

Your responsibility when messaging

You are responsible for ensuring messages sent comply with applicable law, including consent, data protection and unsolicited-communication rules in the recipient's jurisdiction, and with WhatsApp's own terms. The opt-out list is provided as a tool; honouring requests to stop remains your obligation.

Features outside this route

Tappable buttons and product cards are features of Meta's official API and cannot be delivered by a self-hosted gateway. They are excluded from this scope.

Your data

All store and customer data remains the property of Nature's Joy and stays on infrastructure you control. No data is transmitted to Setups Works or to any third-party analytics or messaging service. Store access is read-only with a single exception: creating the discount coupons you request. Access can be revoked at any time from WordPress without notice to us.

Scope and ownership

The quoted fee, ₹25,000 or ₹35,000 depending on the messaging route chosen, covers the build, deployment, configuration, documentation and handover of the thirteen modules described in this document. Source code is delivered to a repository owned by Nature's Joy. Work outside this scope, including additional modules, custom metrics, integrations or ongoing support, is quoted separately.

Validity and payment

This quotation is valid for 30 days from the date of issue. Payment terms to be agreed in writing before work commences.

Third-party software

The WhatsApp gateway is independent open-source software, provided under its own licence and maintained by its own authors. Setups Works does not control its development, availability or continued compatibility with WhatsApp.

How this proceeds

STEP 1

Confirm scope

Agree which modules matter most and confirm the commercial terms.

STEP 2

Walkthrough

See the platform running against your own data, before rollout.

STEP 3

Deploy

Platform and gateway set up on your infrastructure and verified.

STEP 4

Handover

Training, documentation, and the code in your own repository.
