

PROPOSAL · NATURE'S JOY HERBAL COSMETICS

PulseCommerce

Customer intelligence and WhatsApp campaigns for your WooCommerce store — built on your own infrastructure, with no per-message fees.

₹20,000

One-time build

₹0

Per message, forever

13

Modules delivered

WooCommerce reports on orders. It says nothing about people.

Your admin shows sales by date and a list of top products. It is transaction-centric by design. Every question below needs computation across your entire order history, and none can be read off a WooCommerce screen.

Who is leaving

Which customers have quietly stopped buying, judged against their own reorder rhythm rather than a fixed rule.

What it is worth

What each customer is likely to spend next, and how exposed the business is if the top few walk away.

How to reach them

Once a group worth contacting is identified — how do you actually message them without exporting a spreadsheet?

Twelve months, measured

Every figure on the next five slides was computed from [naturesjoystore.com](#) during development.
Nothing here is an estimate or an illustration.

A business that has found its level

Revenue climbed steeply to November 2025, then settled into a band between ₹5.7L and ₹7.0L a month and stayed there for eight months. Growth from here comes from the customers you already have, not from the trend continuing on its own.

One product carries a third of the business

This is the single largest risk in the data. A stock-out, a supply problem or a formulation change on one product would take a third of revenue with it. Inventory planning and reorder alerts exist for exactly this.

Tamil Nadu is the business

86.5%

Of revenue comes from Tamil Nadu

₹19.1L

From Chennai alone — 27% of everything

₹5.1L

Karnataka, the clearest expansion signal

Concentration this high is a strength for logistics and a risk for growth. Karnataka is already buying without being targeted, which makes it the cheapest market to test a campaign in.

8,551 people bought once and never came back

If a win-back campaign converts	Customers returning	Revenue at ₹434 AOV
2%	171	₹74,213
5%	428	₹1,85,768
10%	855	₹3,71,537

At a 2% conversion — deliberately pessimistic for customers who have already bought from you once — a single win-back campaign returns more than three times the cost of building this platform.

Thirteen modules

01 Revenue & performance

Every KPI against the equal-length prior period

02 Customer analytics

RFM, ten segments, tiers, lifetime value, churn risk

03 Customer profiles

Full history, channel, device, what they buy

04 Acquisition & retention

Channels, devices, cohorts, time to second order

05 Campaigns & audiences

Goal-driven audience builder with live reach

06 WhatsApp campaigns

Nine templates, personalisation, coupons, pacing

07 Shared WhatsApp inbox

Replies, with the customer's history beside them

08 Product analytics

ABC classification, refund rate, basket affinity

09 Inventory planning

Days of cover, reorder points, revenue at risk

10 Orders & operations

Register, payments, coupons, trading heatmap

11 Forecasting

Trend and seasonality with a 95% band

12 Geography

Revenue by state, city and region

13 Reports & exports

Ten reports as Excel, PDF or CSV

All included

One price, no per-module charge

Every customer, scored and explained

- **RFM segmentation** across the ten standard segments, from Champions to Lost, scored within your own base so it stays meaningful as you grow.
- **Predicted lifetime value** per customer, discounted by their churn risk.
- **Churn risk** judged against each person's own reorder rhythm — a monthly buyer and a seasonal buyer are assessed correctly.
- **Revenue concentration** with a Gini coefficient, quantifying exposure if the best customers leave.
- **All 11,286 customers listed**, never a capped sample, with orders expandable in place.

Segments, from your data

Champions	Highest value, active
Loyal	Frequent, reliable
At Risk	Valuable, going quiet
Cannot Lose Them	Top spend, lapsed
Hibernating	Low value, lapsed
817 lapsed	₹3,91,288

Each segment maps directly to a campaign audience — one click from "who" to "message them".

Messages that know what they bought

- **Nine templates** — reorder their product, new in a category they shop, win back a lapsed customer, convert a one-time buyer, thank a VIP, request a review, coupon offers, announcements.
- **Personalised per customer** — their name, the product they spend most on, a link to it, its photo, when they last ordered, what they have spent.
- **Discount coupons** created from the campaign screen, limited to one use each and restricted to the product being promoted.
- **Paced delivery** that recovers by itself if the gateway restarts mid-campaign.

As a customer receives it

Hi Priya, it has been a while since your last **Manjistha Herbal Soap**.

Here is 10% off with code **SAVE10NOW**:

naturesjoystore.com/product/manjistha-soap

— Nature's Joy

Product name, link, photo and discount all resolved from that customer's own order history.

Replies land somewhere useful

Answering "is this back in stock?" is a different conversation when you can see the person asking has ordered eleven times and spent ₹14,200.

The customer, not a number

Every conversation shows who it is, how often they have ordered and what they have spent — with one click to their full profile.

Reply with anything

Text, an image or video, or a product pulled straight from your catalogue with its photo and buy link.

Start the conversation

Message any customer directly by number, without waiting for them to write first.

The opt-out list applies here too. Someone who asks the business to stop is not messaged again, by a campaign or by hand.

Three pieces, all yours

Your WooCommerce store

Read for orders, products and customers. The storefront is never in the query path, so no customer waits on your analysis.

PulseCommerce

Pulls your history once, caches it, and computes every figure from that cache. Changing a date range is instant.

Your WhatsApp gateway

Holds the WhatsApp connection on a server you own. Numbers never reach a third-party messaging service.

Nothing leaves your control

Customer names, numbers and order history stay on your own infrastructure. No analytics vendor, no messaging vendor, no copy of your customer list anywhere else.

It reads; it writes one thing

The only change made to your store is creating a discount coupon when you ask for one. Nothing modifies an order, a product or a setting.

Four gates between you and 11,286 people

1 • Dry run

Resolves the real recipient list and sends nothing. Shows who was excluded and why, plus the message as the first recipient would read it.

2 • Test send

One message to a number you type by hand. It cannot reach a customer.

3 • Typed confirmation

You type the exact recipient count. The audience is recalculated and the send refused if it changed.

4 • Opt-out list

Applied on the server after the audience is built, so no filtering mistake can route around it.

Duplicate numbers across records are collapsed so a household is messaged once, and every excluded recipient is counted and categorised — so "sent 9,800 of 11,286" always has an explanation.

Two ways to send WhatsApp

	Official WhatsApp Cloud API	PulseCommerce, self-hosted
Cost per message	Billed per conversation, in INR	Zero
Marketing messages	Charged at the marketing rate	No charge
Message templates	Pre-approval required by Meta	Write and send immediately
Setup	Meta Business verification	Scan a QR code
Running cost	Per conversation, forever	A small server, roughly ₹500/month
Tappable buttons	Yes	No — link previews instead
Delivery guarantee	Official, guaranteed	Unofficial; use a dedicated number

Meta's per-conversation rates change by country and category and should be confirmed against their current published pricing before you commit. The structural difference does not change: one bills per message, the other does not.

One campaign to your customer base

11,286 customers. Because the exact Meta rate varies, here is the cost across the plausible range — and what it becomes at one campaign a month.

If a marketing conversation costs	One campaign	Monthly, for a year	PulseCommerce
₹0.50	₹5,643	₹67,716	₹0
₹0.75	₹8,465	₹1,01,574	₹0
₹1.00	₹11,286	₹1,35,432	₹0

2 campaigns

Break-even against the ₹20,000 build, at the middle rate

₹81,574

Saved in year one at one campaign a month, after paying for the build

Built for a store your size

Measured against your live store, not a test fixture.

20,490

Orders analysed

11,286

Customers scored

0.7s

Typical page load

81%

Data transfer removed by trimming
what is never read

Why it is fast

Your entire order history is pulled once and cached. Every metric is computed from that cache, so changing a date range costs milliseconds instead of another wait on your store.

Why your store stays fast

Analysis never touches the database serving your storefront. Pulls are paced and retried, so a sync reads as ordinary traffic rather than a spike.

What you receive

- **The platform**, all thirteen modules, deployed and verified against your live store.
- **The source code**, in a repository Nature's Joy owns outright.
- **WhatsApp gateway** installed and connected on your server.
- **Documentation** covering setup, configuration, architecture and troubleshooting.
- **Metric definitions in writing**, so every figure can be reconciled against WooCommerce rather than taken on trust.
- **Handover session** covering day-to-day use and how to read each module.

Not included

Stated plainly so there are no surprises later.

Server hosting for the WhatsApp gateway, roughly ₹500 per month, billed by your provider. Setups Works can manage it, quoted separately.

A dedicated phone number for WhatsApp sending, which should not be the main business line.

INVESTMENT

₹20,000, one time

Item	Cost
Platform build, thirteen modules	Included
WhatsApp gateway setup and connection	Included
Deployment, configuration and verification	Included
Documentation and handover session	Included
Source code ownership	Included
Total, one time	₹20,000

₹0

Per message sent, permanently

2 campaigns

Until the build has paid for itself

₹3,91,288

Lapsed customer value the first campaign targets

How this proceeds

STEP 1

Confirm scope

Agree which modules matter most and confirm the commercial terms.

STEP 2

Walkthrough

See the platform running against your own data, before rollout.

STEP 3

Deploy

Platform and gateway set up on your infrastructure and verified.

STEP 4

Handover

Training, documentation, and the code in your own repository.
